

[PRODUCT SHEET]

Product:	DURAschedule
	Scheduling application
	Trigger messages to specified destinations (handheld devices, 3rd party management systems)
	Operates on highly reliable embedded Java Server, OJS

DURAschedule Scheduling application

DURAschedule automatically triggers messages to specified destinations (handheld devices, DURAsuite modules, third party management systems) at specific times to assist in managing the distribution of scheduled tasks. DURAschedule provides an easy-to-use and highly-customisable module that can manage up to 500 simultaneous schedules.

DURAschedule can assist with:

Allowing messages to be sent at specified times, dates and custom intervals automatically. Schedules can be configured to start immediately or at a date and time in the future and continue until a specified date or indefinitely. Similarly, recurrence patterns can be used to repeat messages at specific intervals, which can then be configured to cease after a specific number of recurrences or at a certain time or date.

Features:

- **Simultaneous schedules** – Allows up to 500 individual schedules to be created and operated simultaneously.
- **Configurable messaging options including:**
 - Call ID
 - Message body
 - Subject
 - Beep code
 - Priority
- **Third party integration** – Ability to utilise any 3rd party system that is connected via DURAlink.
- **Messages can also be sent to other DURAsuite modules** (ie. DURAdispatch) to enhance messaging functions.
